C.1 CA 750

# DOCUMENTATION OF ENVIRONMENTAL INDICATOR DETERMINATION

Interim Final 2/5/99

# RCRA Corrective Action Environmental Indicator (EI) RCRIS code (CA750)

#### Migration of Contaminated Groundwater Under Control

Facili	ty Maine:	Henkel Corporation	
Facili	ty Address:	322 West Main Street, Morenci, MI	
Facili	ty EPA ID #:	MID 058 723 867	
<b>1.</b>	groundwater m	le relevant/significant information on known and reasonably suspected releases edia, subject to RCRA Corrective Action (e.g., from Solid Waste Management lated Units (RU), and Areas of Concern (AOC)), been considered in this EI	
	<u>X</u>	If yes - check here and continue with #2 below.	
	·	If no - re-evaluate existing data, or	E .
- 63	s 3	if data are not available skip to #6 and enter"IN" (more information needed)	status code.

#### BACKGROUND

#### **Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

#### Definition of "Migration of Contaminated Groundwater Under Control" EI

A positive "Migration of Contaminated Groundwater Under Control" EI determination ("YE" status code) indicates that the migration of "contaminated" groundwater has stabilized, and that monitoring will be conducted to confirm that contaminated groundwater remains within the original "area of contaminated groundwater" (for all groundwater "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Migration of Contaminated Groundwater Under Control" EI pertains ONLY to the physical migration (i.e., further spread) of contaminated ground water and contaminants within groundwater (e.g., non-aqueous phase liquids or NAPLs). Achieving this EI does not substitute for achieving other stabilization or final remedy requirements and expectations associated with sources of contamination and the need to restore, wherever practicable, contaminated groundwater to be suitable for its designated current and future uses.

#### **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

-		

<u>X</u>	If yes - continue after identifying key contaminants, citing appropriate "levels," and referencing supporting documentation.
<u></u>	If no - skip to #8 and enter "YE" status code, after citing appropriate "levels," and referencing supporting documentation to demonstrate that groundwater is not "contaminated."
	If unknown - skip to #8 and enter "IN" status code.
Groundwater hat trichloroethene	s been analyzed in all monitoring wells in 1991 and 2002. In 1991, the concentration of exceeded the U.S. EPA's Maximum Contaminant Level (MCL) for drinking water in one
1,1 dic dichlor	lowing chemicals were detected in Monitoring Well 3 (MW3): hloroethane, 1,1 dichloroethene, bromodichloromethane, chloroform, cis-1,2 oethene, trans 1,2 dichlroethene, trichloroethene, trichlorofluoromethane, 1,1,1 roethane and vinyl chloride.
	Rationale and R Groundwater ha trichloroethene monitoring well In 2002, the foll 1,1 dic dichlor

Only vinyl chloride exceeds the U.S. EPA's MCL of 2 parts per billion, which is equal to the Michigan Department of Environmental Quality Part 201 standard. The actual concentration of vinyl chloride in MW3 is 32 parts per billion. This information can most recently be located in the US EPA Supplemental Risk Analysis for Henkel Surface Technologies dated April 22, 2003.

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriate "levels" (appropriate for the protection of the groundwater resource and its beneficial uses).

3.	Has the migration of contaminated groundwater stabilized (such that contaminated groundwater is expected to remain within "existing area of contaminated groundwater" as defined by the monitoring locations designated at the time of this determination)?
	If yes - continue, after presenting or referencing the physical evidence (e.g., groundwater sampling/measurement/migration barrier data) and rationale why contaminated groundwater is expected to remain within the (horizontal or vertical) dimensions of the "existing area of groundwater contamination".
	If no (contaminated groundwater is observed or expected to migrate beyond the designated locations defining the "existing area of groundwater contamination" <sup>2</sup> ) - skip to #8 and enter "NO" status code, after providing an explanation.
	If unknown - skip to #8 and enter "IN" status code.
	Rationale and Reference(s):
	Historical groundwater analysis from 1991 to the present indicates decreasing concentrations of all contaminants, with the exception of vinyl chloride, which is the final degradation product of trichloroethene. As attenuation (biodegradation and natural dechlorination) occurs in the groundwater system, it is expected that vinyl chloride will decrease as well. This will be verified by Henkel's groundwater monitoring.

<sup>&</sup>lt;sup>2</sup> "existing area of contaminated groundwater" is an area (with horizontal and vertical dimensions) that has been verifiably demonstrated to contain all relevant groundwater contamination for this determination, and is defined by designated (monitoring) locations proximate to the outer perimeter of "contamination" that can and will be sampled/tested in the future to physically verify that all "contaminated" groundwater remains within this area, and that the further migration of "contaminated" groundwater is not occurring. Reasonable allowances in the proximity of the monitoring locations are permissible to incorporate formal remedy decisions (i.e., including public participation) allowing a limited area for natural attenuation.

4.	Does "contaminated" groundwater discharge into surface water bodies?				
	<u>X</u>	If yes - continue after identifying potentially affected surface water bodies.			
		If no - skip to #7 (and enter a "YE" status code in #8, if #7 = yes) after providing an explanation and/or referencing documentation supporting that groundwater "contamination" does not enter surface water bodies.			
		If unknown - skip to #8 and enter "IN" status code.			
-	Rationale and Re	eference(s):			

Groundwater discharges into Bean Creek, as determined by the geology and groundwater flow regime. which is the western border of the facility. Bean Creek flows from south to north. The flow is significant with a mean of 22 cubic feet/sec (cfs). This flow is based on 22 years of U.S. Geological Survey gauging data at Powers, OH, about 15 miles upstream.

5.	maximum conce appropriate grou discharging cont	of "contaminated" groundwater into surface water likely to be "insignificant" (i.e., the ntration <sup>3</sup> of each contaminant discharging into surface water is less than 10 times their ndwater "level," and there are no other conditions (e.g., the nature, and number, of aminants, or environmental setting), which significantly increase the potential for pacts to surface water, sediments, or eco-systems at these concentrations)?
		If yes - skip to #7 (and enter "YE" status code in #8 if #7 = yes), after documenting: 1) the maximum known or reasonably suspected concentration of key contaminants discharged above their groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) provide a statement of professional judgement/explanation (or reference documentation) supporting that the discharge of groundwater contaminants into the surface water is not anticipated to have unacceptable impacts to the receiving surface water, sediments, or eco-system.
	_ <b>X</b>	If no - (the discharge of "contaminated" groundwater into surface water is potentially significant) - continue after documenting: 1) the maximum known or reasonably suspected concentration <sup>3</sup> of <u>each</u> contaminant discharged above its groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) for any contaminants discharging into surface water in concentrations <sup>3</sup> greater than 100 times their appropriate groundwater "levels," the estimated total amount (mass in kg/yr) of each of these contaminants that are being discharged (loaded) into the surface water body (at the time of the determination), and identify if there is evidence that the amount of discharging contaminants is increasing.
		If unknown - enter "IN" status code in #8.
	Rationale and Re	eference(s):

Employing a mixing zone dilution factor of 10, with vinyl chloride at 32 parts per billion, the ten fold dilution would result in a vinyl chloride concentration of 3.2 parts per billion, which is greater than the Michigan Department of Environmental Quality Part 201 groundwater guidance allows, which is 2 parts per billion.

<sup>&</sup>lt;sup>3</sup> As measured in groundwater prior to entry to the groundwater-surface water/sediment interaction (e.g., hyporheic) zone.

6.	Can the discharge of "contaminated" groundwater into surface water be shown to be "currently acceptable" (i.e., not cause impacts to surface water, sediments or eco-systems that should not be allowed to continue until a final remedy decision can be made and implemented*)?					

If yes - continue after either: 1) identifying the Final Remedy decision incorporating these conditions, or other site-specific criteria (developed for the protection of the site's surface water, sediments, and eco-systems), and referencing supporting documentation demonstrating that these criteria are not exceeded by the discharging groundwater; OR 2) providing or referencing an interim-assessment,<sup>5</sup> appropriate to the potential for impact, that shows the discharge of groundwater contaminants into the surface water is (in the opinion of a trained specialists, including ecologist) adequately protective of receiving surface water, and eco-systems, until such time when a full assessment and final remedy decision can be made. Factors which should be considered in the interimassessment (where appropriate to help identify the impact associated with discharging groundwater) include: surface water body size, flow, use/classification/habitats and contaminant loading limits, other sources of surface water/sediment contamination, surface water and sediment sample results and comparisons to available and appropriate surface water and sediment "levels," as well as any other factors, such as effects on ecological receptors (e.g., via bio-assays/benthic surveys or site-specific ecological Risk Assessments), that the overseeing regulatory agency would deem appropriate for making the EI determination.

<u> </u>	If no - (the discharge of "contaminated" groundwater can not be shown to be "currently
	acceptable") - skip to #8 and enter "NO" status code, after documenting the currently
	unacceptable impacts to the surface water body, sediments, and/or eco-systems.

If unknown - skip to 8 and enter "IN	I" status code
--------------------------------------	----------------

#### Rationale and Reference(s):

Calculations of a mixing zone dilution factor indicate that the vinyl chloride will be diluted to values significantly less than the drinking water standard for Michigan Part 201 guidance. The calculation was made using an estimate of groundwater flux to Bean Creek, coupled with the United States Geological Survey (USGS) gauging data on Bean Creek at Powers, Ohio. This calculation uses conservative input parameters.

<sup>&</sup>lt;sup>4</sup> Note, because areas of inflowing groundwater can be critical habitats (e.g., nurseries or thermal refugia) for many species, appropriate specialist (e.g., ecologist) should be included in management decisions that could eliminate these areas by significantly altering or reversing groundwater flow pathways near surface water bodies.

<sup>&</sup>lt;sup>5</sup> The understanding of the impacts of contaminated groundwater discharges into surface water bodies is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration to be reasonably certain that discharges are not causing currently unacceptable impacts to the surface waters, sediments or eco-systems.

7.	necessary) be col	er monitoring / measurement data (and surface water/sediment/ecological data, as lected in the future to verify that contaminated groundwater has remained within the crtical, as necessary) dimensions of the "existing area of contaminated groundwater?"
	<u>X</u>	If yes - continue after providing or citing documentation for planned activities or future sampling/measurement events. Specifically identify the well/measurement locations which will be tested in the future to verify the expectation (identified in #3) that groundwater contamination will not be migrating horizontally (or vertically, as necessary) beyond the "existing area of groundwater contamination."
		If no - enter "NO" status code in #8.
		If unknown - enter "IN" status code in #8.
	Rationale and R	eference(s):
	Yes. Henkel Suassistance.	rface Technologies has retained a consultant, The Dragun Corporation, to provide this

#### **BACKGROUND**

#### **Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

#### Definition of "Migration of Contaminated Groundwater Under Control" EI

A positive "Migration of Contaminated Groundwater Under Control" EI determination ("YE" status code) indicates that the migration of "contaminated" groundwater has stabilized, and that monitoring will be conducted to confirm that contaminated groundwater remains within the original "area of contaminated groundwater" (for all groundwater "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Migration of Contaminated Groundwater Under Control" EI pertains ONLY to the physical migration (i.e., further spread) of contaminated ground water and contaminants within groundwater (e.g., non-aqueous phase liquids or NAPLs). Achieving this EI does not substitute for achieving other stabilization or final remedy requirements and expectations associated with sources of contamination and the need to restore, wherever practicable, contaminated groundwater to be suitable for its designated current and future uses.

#### **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2.	"levels" (i.e., ap	r known or reasonably suspected to be "contaminated" above appropriately protective oplicable promulgated standards, as well as other appropriate standards, guidelines, teria) from releases subject to RCRA Corrective Action, anywhere at, or from, the facility?
		If yes - continue after identifying key contaminants, citing appropriate "levels," and referencing supporting documentation.
	.* .	If no - skip to #8 and enter "YE" status code, after citing appropriate "levels," and referencing supporting documentation to demonstrate that groundwater is not "contaminated."
		If unknown - skip to #8 and enter "IN" status code.
•	Rationale and R	Reference(s):

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriate "levels" (appropriate for the protection of the groundwater resource and its beneficial uses).

3.	expected to rema	on of contaminated groundwater <b>stabilized</b> (such that contaminated groundwater is ain within "existing area of contaminated groundwater" as defined by the monitoring ated at the time of this determination)?
	——————————————————————————————————————	If yes - continue, after presenting or referencing the physical evidence (e.g., groundwate sampling/measurement/migration barrier data) and rationale why contaminated groundwater is expected to remain within the (horizontal or vertical) dimensions of the "existing area of groundwater contamination" <sup>2</sup> ).
		If no (contaminated groundwater is observed or expected to migrate beyond the designated locations defining the "existing area of groundwater contamination" <sup>2</sup> ) - skip to #8 and enter "NO" status code, after providing an explanation.
	<del> </del>	If unknown - skip to #8 and enter "IN" status code.
	Rationale and R	eference(s):

		If unknown - skip to #8 and enter "IN" status code.			
	Rationale and R	eference(s):			

5.	maximum conce appropriate grou discharging cont	of "contaminated" groundwater into surface water likely to be "insignificant" (i.e., the ntration <sup>3</sup> of each contaminant discharging into surface water is less than 10 times their ndwater "level," and there are no other conditions (e.g., the nature, and number, of aminants, or environmental setting), which significantly increase the potential for bacts to surface water, sediments, or eco-systems at these concentrations)?
		If yes - skip to #7 (and enter "YE" status code in #8 if #7 = yes), after documenting: 1) the maximum known or reasonably suspected concentration <sup>3</sup> of <u>key</u> contaminants discharged above their groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) provide a statement of professional judgement/explanation (or reference documentation) supporting that the discharge of groundwater contaminants into the surface water is not anticipated to have unacceptable impacts to the receiving surface water, sediments, or eco-system.
		If no - (the discharge of "contaminated" groundwater into surface water is potentially significant) - continue after documenting: 1) the maximum known or reasonably suspected concentration <sup>3</sup> of <u>each</u> contaminant discharged above its groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) for any contaminants discharging into surface water in concentrations <sup>3</sup> greater than 100 times their appropriate groundwater "levels," the estimated total amount (mass in kg/yr) of each of these contaminants that are being discharged (loaded) into the surface water body (at the time of the determination), and identify if there is evidence that the amount of discharging contaminants is increasing.
		If unknown - enter "IN" status code in #8.
	Rationale and Re	eference(s):

 $<sup>^3</sup>$  As measured in groundwater prior to entry to the groundwater-surface water/sediment interaction (e.g., hyporheic) zone.

Page 6

6. Can the discharge of "contaminated" groundwater into surface water be shown to be "currently acceptable" (i.e., not cause impacts to surface water, sediments or eco-systems that should not be allowed to continue until a final remedy decision can be made and implemented<sup>4</sup>)?

If yes - continue after either: 1) identifying the Final Remedy decision incorporating these conditions, or other site-specific criteria (developed for the protection of the site's surface water, sediments, and eco-systems), and referencing supporting documentation demonstrating that these criteria are not exceeded by the discharging groundwater; OR 2) providing or referencing an interim-assessment,<sup>5</sup> appropriate to the potential for impact, that shows the discharge of groundwater contaminants into the surface water is (in the opinion of a trained specialists, including ecologist) adequately protective of receiving surface water, sediments, and eco-systems, until such time when a full assessment and final remedy decision can be made. Factors which should be considered in the interim-assessment (where appropriate to help identify the impact associated with discharging groundwater) include: surface water body size, flow, use/classification/habitats and contaminant loading limits, other sources of surface water/sediment contamination, surface water and sediment sample results and comparisons to available and appropriate surface water and sediment "levels," as well as any other factors, such as effects on ecological receptors (e.g., via bio-assays/benthic surveys or site-specific ecological Risk Assessments), that the overseeing regulatory agency would deem appropriate for making the EI determination.

If no - (the discharge of "contaminated" groundwater can not be shown to be "currently acceptable") - skip to #8 and enter "NO" status code, after documenting the currently unacceptable impacts to the surface water body, sediments, and/or eco-systems.

X If unknown - skip to 8 and enter "IN" status code.

#### Rationale and Reference(s):

The groundwater sampling and analysis report of August 2001 issued by Henkel Corporation through their consultant, Dragun Corporation, indicated trichloroethene and vinyl chloride contamination in monitoring well number 3 in excess of MDEQ Part 201 and EPA Maximum Contaminant Limits for drinking water at the facility. This groundwater flows directly toward Bean Creek, on the westernmost boundary of the site. Review of Preliminary Assessment/Visual Site Inspection records as well as MI Department of Environmental Quality sampling inspections indicated evidence of heavy metals, polychlorinated biphenyls and possible semi-volatile organic contamination in the area of monitoring well 3. Insufficient data had not been presented to date on the leaching of these contaminants to groundwater, nor has the groundwater been tested for these contaminants. There is insufficient data to date on whether the groundwater aquifer is confined, or is hydraulically linked to drinking water aquifers, or if it channels underneath Bean Creek.

<sup>&</sup>lt;sup>4</sup> Note, because areas of inflowing groundwater can be critical habitats (e.g., nurseries or thermal refugia) for many species, appropriate specialist (e.g., ecologist) should be included in management decisions that could eliminate these areas by significantly altering or reversing groundwater flow pathways near surface water bodies.

<sup>&</sup>lt;sup>5</sup> The understanding of the impacts of contaminated groundwater discharges into surface water bodies is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration to be reasonably certain that discharges are not causing currently unacceptable impacts to the surface waters, sediments or eco-systems.

7.	Will groundwater <b>monitoring</b> / measurement data (and surface water/sediment/ecological data, as necessary) be collected in the future to verify that contaminated groundwater has remained within the horizontal (or vertical, as necessary) dimensions of the "existing area of contaminated groundwater?"					
		If yes - continue after providing or citing documentation for planned activities or future sampling/measurement events. Specifically identify the well/measurement locations which will be tested in the future to verify the expectation (identified in #3) that groundwater contamination will not be migrating horizontally (or vertically, as necessary) beyond the "existing area of groundwater contamination."				
		If no - enter "NO" status code in #8.  If unknown - enter "IN" status code in #8.				
	Rationale and R	eference(s):				

8.	EI (event code C	priate RCRIS status codes for the Migration of Contaminated Groundwater Under Control A750), and obtain Supervisor (or appropriate Manager) signature and date on the EI slow (attach appropriate supporting documentation as well as a map of the facility).	1
	· · · · · · · · · · · · · · · · · · ·	YE - Yes, "Migration of Contaminated Groundwater Under Control" has been verified. Based on a review of the information contained in this EI determination, it has been determined that the "Migration of Contaminated Groundwater" is "Under Control" at the	
		facility, EPA ID #, located	
		at Specifically, this determination

Facility EPA	#: MID 060 975 844
ground Manag	vailable relevant/significant information on known and reasonably suspected releases to soil, iter, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste ent Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been considered in termination?
	X If yes - check here and continue with #2 below.
	If no - re-evaluate existing data, or
	if data are not available skip to #6 and enter"IN" (more information needed) status code.
RACKCROUM	

# Definition of Environmental Indicators (for the RCRA Corrective Action)

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

#### **Definition of "Current Human Exposures Under Control" EI**

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

#### **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

#### Current Human Exposures Under Control Environmental Indicator (EI) RCRIS code (CA725) Page 2

2. Are groundwater, soil, surface water, sediments, or air media known or reasonably suspected to be "contaminated" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	Yes	No	?	Rationale / Key Contaminants
Groundwater	X			VOCs > MDEQ Default 201 Cleanup Standards
Air (indoors) <sup>2</sup>		X		
Surface Soil (e.g., <2 ft)	X			VOCs > MDEQ Default 201 Cleanup Standards
Surface Water		X		
Sediment		X		
Subsurf. Soil (e.g., >2 ft)	X			VOCs > MDEQ Default 201 Cleanup Standards
Air (outdoors)		X		

If no (for all media) - skip to #6, and enter "YE," status code after providing or citing
 appropriate "levels," and referencing sufficient supporting documentation demonstrating
that these "levels" are not exceeded.

v	If yes (for any media) - continue after identifying key contaminants in each
<u>X</u>	"contaminated" medium, citing appropriate "levels" (or provide an explanation for the
	determination that the medium could pose an unacceptable risk), and referencing
	supporting documentation.

\_\_\_\_ If unknown (for any media) - skip to #6 and enter "IN" status code.

#### Rationale and Reference(s):

Off-Site RCRA Facility Investigation Report (4/27/95)

On-Site RCRA Facility Investigation Report (5/30/96)

Groundwater monitoring data conducted under the State of Michigan Hazardous Waste Operating License

#### Footnotes:

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>&</sup>lt;sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

Page 3

3. Are there complete pathways between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

Receptor combination (Pathway).

# RCRA Corrective Action Environmental Indicator (EI) RCRIS code (CA725)

## **Current Human Exposures Under Control**

Facility Name:	Henkel Corporation
Facility Address:	322 West Main Street, Morenci, MI
Facility EPA ID #:	MID 058 723 867
groundwater, s	ble relevant/significant information on known and reasonably suspected releases to soil, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been <b>considered</b> in ination?
<u>X</u>	If yes - check here and continue with #2 below.  If no - re-evaluate existing data, or
<u></u>	if data are not available skip to #6 and enter"IN" (more information needed) status code.
BACKGROUND	

# **Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

### Definition of "Current Human Exposures Under Control" EI

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

# **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2. Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be "**contaminated**" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	Yes	No	?		Rationale / Key Contaminants
Groundwater	X			200	Vinyl Chloride, TCE
Air (indoors) <sup>2</sup>		$\mathbf{X}$			
Surface Soil (e.g., <2 ft)	X				Lead
Surface Water		$\mathbf{X}$			
Sediment		$\mathbf{X}$			
Subsurf. Soil (e.g., >2ft)		X			
Air (outdoors)		X			

If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

If yes (for any media) - continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

If unknown (for any media) - skip to #6 and enter "IN" status code.

#### Rationale and Reference(s):

Groundwater has been analyzed in all monitoring wells in 1991 and 2002. In 1991, the concentration of trichloroethene exceeded the U.S. EPA's Maximum Contaminant Level (MCL) for drinking water in one monitoring well (MW3).

In 2002, the following chemicals were detected in Monitoring Well 3 (MW3):

1,1 dichloroethane, 1,1 dichloroethene, bromodichloromethane, chloroform, cis-1,2 dichloroethene, trans 1,2 dichloroethene, trichlorofluoromethane, 1,1,1 trichloroethane and vinyl chloride.

The maximum concentration of vinyl chloride and TCE were found to be 30 ppb and 14 ppb respectively. These levels exceed the MCL and MDEQ residential and industrial drinking water criteria. This information can most recently be located in the US EPA Supplemental Risk Analysis for Henkel Surface Technologies dated April 22, 2003.

Historical groundwater analysis from 1991 to the present indicates decreasing concentrations of all contaminants, with the exception of vinyl chloride, which is the final degradation product of

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>&</sup>lt;sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

Page 3

trichloroethene. As attenuation (biodegradation and natural dechlorination) occurs in the groundwater system, it is expected that vinyl chloride will decrease as well. This will be verified by Henkel's groundwater monitoring.

Groundwater discharges into Bean Creek, as determined by the geology and groundwater flow regime. which is the western border of the facility. Bean Creek flows from south to north. The flow is significant with a mean of 22 cubic feet/sec (cfs). This flow is based on 22 years of U.S. Geological Survey gauging data at Powers, OH, about 15 miles upstream.

In September of 2002, soils inside and outside the fence line of the Henkel facility were sampled and analyzed for volatile and semi volatile organic compounds, poly chlorinated biphenyls, and metals. The surface soil at Waste Storage area number 6 had a maximum lead concentration of 56,000 mg/Kg and far exceeded the MDEQ industrial soil screening criteria. No other chemical contaminants were found at levels posing a human health risk for industrial or commercial use using Michigan Department of Environmental Quality (MDEQ) Part 201 guidance. A Human Health risk assessment conducted by Techlaw Inc. on behalf of the US EPA verified this result in early 2003.

In July of 2004 sediments from Bean Creek, which borders the site on the east, were sampled for Metals, Volatile Organic Compounds, Semi-Volatile Organic Compounds and Poly-Chlorinated Biphenyl compounds. Analytical results indicate that none of these contaminants were found in the Bean Creek sediment sampling locations in excess of MDEQ Part 201 residential soil screening criteria which is conservative when compared to sediment screening criteria

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

Potential **Human Receptors** (Under Current Conditions)

"Contaminated" Media	Residents	Workers	Day-Care	Construction	Trespassers	Recreation	Food <sup>3</sup>
Groundwater	N	N	N	Y	N	N	N
Air (indoors)							
Soil (surface, e.g., <2 ft)	N	Y	N	Y	N	N	N
Surface Water							
Sediment							
Soil (subsurface e.g., >2 ft)							
Air (outdoors)				•			

Instructions for Summary Exposure Pathway Evaluation Table:

- 1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated" as identified in #2 above.
- 2. Enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human

<sup>&</sup>lt;sup>3</sup> Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("\_\_\_"). While these

Receptor combination (Pathway).

training and experience.

If no (pathways are not complete for any contaminated media-receptor combination) - skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional <u>Pathway Evaluation Work Sheet</u> to analyze major pathways).
If yes (pathways are complete for any "Contaminated" Media - Human Receptor combination) - continue after providing supporting explanation.
If unknown (for any "Contaminated" Media - Human Receptor combination) - skip to #6  and enter "IN" status code.
Rationale and Reference(s):
Lead concentration in Waste storage area 6 has lead contamination that greatly exceeds MDEQ part 201 industrial screening criteria and thus provides a potential for exposure to construction worker, routine worker and trespasser. Cleanup of Waste Storage area will be performed by Henkel under a pending agreed order.
Although vinyl chloride in ground water exceeds the residential and commercial drinking water criteria, restrictions are in place to prevent the use of groundwater for potable purposes. However, groundwater exists at shallow levels, 10 to 25 feet below ground surface, the construction worker could come into contact with groundwater during excavation activities.
4. Can the <b>exposures</b> from any of the complete pathways identified in #3 be reasonably expected to be " <b>significant</b> " (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps ever though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?
X If no (exposures can not be reasonably expected to be significant (i.e., potentially "unacceptable") for any complete exposure pathway) - skip to #6 and enter "YE" status code after explaining and/or referencing documentation justifying why the exposures (from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."

If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education,

 If yes (exposures could be reasonably expected to be "significant" (i.e., potentially "unacceptable") for any complete exposure pathway) - continue after providing a description (of each potentially "unacceptable" exposure pathway) and explaining and/or referencing documentation justifying why the exposures (from each of the remaining complete pathways) to "contamination" (identified in #3) are not expected to be "significant."
 If unknown (for any complete pathway) - skip to #6 and enter "IN" status code

#### Rationale and Reference(s):

Currently, the Henkel Morenci facility is not in operation and surrounded by a fence and locked gate, limiting access to authorized personnel only. Thus the exposure to trespassers and routine workers due to surface soil contamination is negligible. If any worker or construction access is required, appropriate personal protective equipment will be used and personnel will have the required safety training to work in potentially contaminated areas. The concentration of trichloroethylene (14 ppb) and vinyl chloride (30 ppb) detected in ground water is well below the MDEQ ground water contact criteria which is 37000 ppb and 570 ppb respectively. Thus the cumulative risk of construction workers due to inhalation, ingestion and dermal contact from ground water is expected to be not significant and falling within the risk range of 1e-04 to 1e-06.

	If yes (all "significant" exposures have been shown to be within acceptable limits) - continue and enter "YE" after summarizing <u>and</u> referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a site-specific Human Health Risk Assessment).
· 	If no (there are current exposures that can be reasonably expected to be "unacceptable")-continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.
_	If unknown (for any potentially "unacceptable" exposure) - continue and enter "IN" status code

<u>X</u>	YE - Yes, "Current Human Exposures Under Control" review of the information contained in this EI Determin Exposures" are expected to be "Under Control" at the ID # MID 058 723 867, located at 322 West Main Str and reasonably expected conditions. This determination Agency/State becomes aware of significant changes at the state of	ation, "Current Human  Ienkel Corporation facilite  eet, Morenci, MI, under continue will be re-evaluated wher
	NO - "Current Human Exposures" are NOT "Under C	ontrol."
	IN - More information is needed to make a determina	ation.

BACKGROUND Definition of Environmental Ind	icators (for the RCRA Corrective Action)	*	

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

#### Definition of "Current Human Exposures Under Control" EI

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" BI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

#### Duration / Applicability of EI Determinations

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2.	Are groundwater, soil, surface water, sediments, or air media known or reasonably suspected to be
	"contaminated" above appropriately protective risk-based "levels" (applicable promulgated standards, as
	well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA
	Corrective Action (from SWMUs, RUs or AOCs)? Insufficient Information

Air (indoors)<sup>2</sup>
Surface Soil (e.g., <2 ft)
Surface Water
Sediment
Subsurf. Soil (e.g., >2ft)
Air (outdoors)

Yes

No

 If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstratin that these "levels" are not exceeded.
 If yes (for any media) - continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.
 If unknown (for any media) - skip to #6 and enter "IN" status code.

Rationale / Key Contaminants

Rationale and Reference(s):

Key ground water contaminants include:

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>&</sup>lt;sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

# BACKGROUND

**Facility Name:** 

# **Definition of Environmental Indicators (for the RCRA Corrective Action)**

Henkel Corporation

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

### Definition of "Current Human Exposures Under Control" EI

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

## **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2. Are groundwater, soil, surface water, sediments, or air media known or reasonably suspected to be "contaminated" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

Yes	<u>No</u>	?	200	54	Rationale / Key Contaminants
X		17	2.7		volatiles
	X				
	X				
	X				
	X				
	X				
	X				
		X X X X X X	X X X X X	X X X X X	X X X X X

If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

X If yes (for any media) - continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

\_\_\_\_\_ If unknown (for any media) - skip to #6 and enter "IN" status code.

#### Rationale and Reference(s):

Key ground water contaminants include: The last time that MDEQ took groundwater samples (split with consultants) at Henkel (Morenci, Michigan) was on 08/04/1998. Four wells were sampled-three of these were non-detect for volatiles (Method 8260). One well, MW-3, had the following volatiles detected: vinyl chloride (5.4 ppb); 1,1-dichloroethene (1.1 ppb); cis-1,2-dichloroethene (46 ppb); and trichloroethene (17 ppb).

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>&</sup>lt;sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

Page 4

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

#### Potential Human Receptors (Under Current Conditions)

"Contaminated" Media Groundwater	Residents	Workers no	Day-Care no	Construction ves	Trespassers	Recreation	Food <sup>3</sup> yes
Air (indoors)	_no	_no	_no	ycs			
Soil (surface, e.g., <2 ft)							
Surface Water	_yes	_no			_no	_no	_yes
Sediment	_yes	_no			_no	_no	_yes
Soil (subsurface e.g., >2 ft)			**				_no
Air (outdoors)	_no	_no	_no	_no	_no		

Instructions for **Summary Exposure Pathway Evaluation Table**:

- 1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated" as identified in #2 above.
- 2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("\_\_\_"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

	skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional <u>Pathway Evaluation Work Sheet</u> to analyze major pathways).
<u>X</u>	If yes (pathways are complete for any "Contaminated" Media - Human Receptor combination) - continue after providing supporting explanation.
	If unknown (for any "Contaminated" Media - Human Receptor combination) - skip to #6 and enter "IN" status code.

If no (pathways are not complete for any contaminated media-receptor combination) -

Rationale and Reference(s): Releases to groundwater have occurred and these releases may have entered Bean Creek immediately adjacent to the facility property.

<sup>&</sup>lt;sup>3</sup> Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

Page 5

4.	Can the <b>exposures</b> from any of the complete pathways identified in #3 be reasonably expected to be " <b>significant</b> " (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps eve though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?				
		X	If no (exposures can not be reasonably expected to be significant (i.e., potentially "unacceptable") for any complete exposure pathway) - skip to #6 and enter "YE" status code after explaining and/or referencing documentation justifying why the exposures (from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."		
			If yes (exposures could be reasonably expected to be "significant" (i.e., potentially "unacceptable") for any complete exposure pathway) - continue after providing a description (of each potentially "unacceptable" exposure pathway) and explaining and/or referencing documentation justifying why the exposures (from each of the remaining complete pathways) to "contamination" (identified in #3) are not expected to be "significant."		
		**************************************	If unknown (for any complete pathway) - skip to #6 and enter "IN" status code		

Rationale and Reference(s): Releases to groundwater have occurred and these releases may have entered Bean Creek immediately adjacent to the facility property. The pathway is from groundwater under the facility entering Bean Creek. This pathway encompasses sediments in Bean Creek. Based on analytical results for groundwater at the facility, dated August, 1998, levels of contamination are only slightly above residential limits and can not be reasonably expected to be significant.

<sup>&</sup>lt;sup>4</sup> If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education, training and experience.

		If yes (all "significant" exposures have been shown to be within acceptable limits) - continue and enter "YE" after summarizing <u>and</u> referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a site-specific Human Health Risk Assessment).
, *		If no (there are current exposures that can be reasonably expected to be "unacceptable")-continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.
	***************************************	If unknown (for any potentially "unacceptable" exposure) - continue and enter "IN" status code

6.	Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):				
	X	YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the <u>Henkel Corporation</u> facility, EI ID # <u>MID 058 723 867</u> , located at <u>322 West Main Street, Morenci, MI</u> , under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.  NO - "Current Human Exposures" are NOT "Under Control."	PA ıt

	X	If yes - check here and continue with #2 below.	
		If no - re-evaluate existing data, or	
		if data are not available skip to #6 and enter"IN" (more information needed) status code.	

#### BACKGROUND

#### Definition of Environmental Indicators (for the RCRA Corrective Action)

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

#### Definition of "Migration of Contaminated Groundwater Under Control" EI

A positive "Migration of Contaminated Groundwater Under Control" EI determination ("YE" status code) indicates that the migration of "contaminated" groundwater has stabilized, and that monitoring will be conducted to confirm that contaminated groundwater remains within the original "area of contaminated groundwater" (for all groundwater "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

#### Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Migration of Contaminated Groundwater Under Control" EI pertains ONLY to the physical migration (i.e., further spread) of contaminated ground water and contaminants within groundwater (e.g., non-aqueous phase liquids or NAPLs). Achieving this EI does not substitute for achieving other stabilization or final remedy requirements and expectations associated with sources of contamination and the need to restore, wherever practicable, contaminated groundwater to be suitable for its designated current and future uses.

#### **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).
